Introduction

This document defines the user stories and use cases for the Automated KYC Verification Platform designed for banks and NBFCs. The purpose of this document is to capture user requirements, business interactions, and operational workflows associated with the digital KYC verification process.

The document outlines the expected interactions between customers, KYC officers, and verification systems to support secure, scalable, and compliant customer onboarding workflows.

Business Objective

The objective of the Automated KYC Verification Platform is to reduce manual intervention in KYC verification processes while improving customer onboarding experience, operational efficiency, verification accuracy, and regulatory compliance.

The platform aims to enable customers to complete KYC verification remotely while allowing officers to make faster and more informed verification decisions through automated verification reports and centralized review workflows.

Stakeholders

- Customers
- KYC Verification Officers
- Operations Team
- Fraud Detection Team
- Compliance Team
- Banks and NBFC Management
- Document Verification Providers

User Stories

US-1.

As a customer,

I want to complete KYC verification digitally,
so that I can complete the onboarding process without visiting the branch physically.

Acceptance Criteria:

- Customer shall be able to upload KYC documents through the mobile application.
- Customer shall receive OTP verification for identity confirmation.
- Customer shall receive final verification status notifications.

US-2.

As a KYC verification officer,

I want to review automated verification reports,
so that I can make faster and more accurate approval decisions.

Acceptance Criteria:

- Officers shall receive verification reports on the dashboard.
- Officers shall be able to approve, reject, or request manual verification.

US-3.

As a fraud detection team member,

I want digitally verified customer claims and document validation reports, so that fraudulent verification attempts can be identified more effectively.

Acceptance Criteria:

- Fraud detection teams shall have access to verification logs and reports.
- The system shall flag suspicious or duplicate documents automatically.

Use Case: KYC Verification Approval

Primary Actor:

KYC Verification Officer

Goal:

To review automated KYC verification reports and approve, reject, or request manual verification based on verification outcomes.

Preconditions:

- Customer has submitted the KYC verification request.
- Required documents have been uploaded successfully.
- Document verification process has been completed.

Main Flow:

1. Customer submits KYC verification request.
2. System prompts the customer to scan and upload required documents.
3. System performs OTP-based identity verification.
4. System validates uploaded documents against integrated repositories.
5. System generates a verification report.
6. Verification report is forwarded to the KYC officer dashboard.
7. Officer reviews the verification report.
8. Officer approves, rejects, or requests manual verification.
9. Final verification status is communicated to the customer.

Postconditions:

- Customer verification status is updated in the system.
- Verification logs are stored for audit purposes.

Alternative Flow

Scenario: Additional Documents Required

1. KYC officer requests additional documents.
2. Customer receives notification regarding pending documentation.
3. Customer uploads additional documents through the application.
4. System validates newly uploaded documents.
5. Updated verification report is forwarded to the KYC officer.
6. Officer reviews the updated report and makes the final decision.

Exception Flow

Scenario: Repository API Failure

1. Customer uploads required documents.
2. System initiates repository verification process.
3. Primary repository API becomes unavailable.
4. System attempts verification through backup repository services.
5. If backup verification also fails, the customer is notified regarding technical issues.
6. Customer is provided with the following options:
 - Retry verification later
 - Proceed with manual KYC verification

Business Rules

- Aadhaar-linked OTP verification shall be mandatory.
- Uploaded documents shall pass repository validation before approval.
- Duplicate or suspicious documents shall be flagged automatically.
- Final verification authority shall remain with the KYC officer.
- Verification activities shall be logged for audit and compliance purposes.

Non-Functional Requirements

- The system shall maintain minimum uptime availability of 99%.
- Verification reports shall be generated within predefined SLA timelines.
- Customer data shall be encrypted during storage and transmission.
- Audit logs shall be maintained for all verification activities.
- The system shall comply with RBI and KYC compliance regulations.

Success Metrics

- Reduce manual verification workload by 60%
- Reduce customer onboarding turnaround time
- Improve verification accuracy
- Improve operational scalability during peak verification volumes
- Reduce fraudulent onboarding attempts
